

**SYSTEM AND METHOD FOR COMPUTER
NETWORK VIRUS EXCLUSION**

Abstract of the Disclosure

5 A method of network virus exclusion comprises identifying client
computers that are at least one of virus susceptible and virus infected, and
isolating those virus susceptible client computers and virus infected client
computers from authorized communication with a server of the network.
A virus exclusion network system comprises a client computer including
10 a virus protector and a network server including a virus monitor. The
virus monitor is configured for preventing an authorized network
connection between the client computer and the server when the client
computer fails to produce at least one of a report an up-to-date virus scan
of the client computer and a report of enablement of the virus protector of
15 the client computer.
